PoetryDNA — NLP Authorship Attribution

Classifying stanzas from 6 classical poets using stylometric features, TF-IDF, and LightGBM

Authors: Mehtab Singh

Dataset: 2,569 balanced stanzas — Shakespeare, Keats, Milton, Tennyson, Coleridge, Wordsworth

Final Model: LightGBM · Hand-crafted + TF-IDF Word N-grams + Char N-grams

Final NLP Accuracy: 81.36%

---

1. Setup & Imports

All libraries, global settings, and reproducibility seeds are configured here.
We suppress warnings for clean output and pin `random_state=42` throughout for reproducibility.

In [1]:
```
!pip install pronouncing textstat lightgbm xgboost mlflow --quiet
```

```

2. Dataset Loading & EDA

We load the pre-assembled PoetryDNA CSV (2,569 stanzas from Project Gutenberg + HuggingFace).
The dataset is already balanced across 6 poets, which is confirmed by the class distribution chart below.

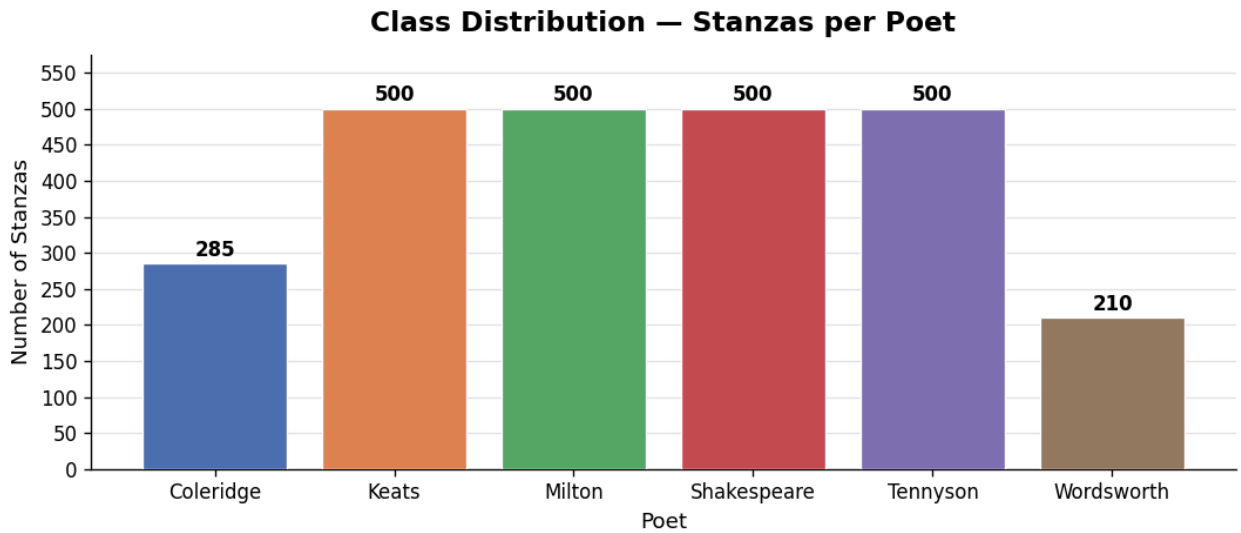
In [3]:
```
df = pd.read_csv("/kaggle/input/datasets/mehtabsingh3711/poetrydna-classifier/

print(f"Dataset shape : {df.shape}")
print(f"Columns       : {list(df.columns)}")
print(f"\nClass distribution:")
print(df["label"].value_counts().to_string())
```

```
Dataset shape : (2495, 2)
Columns       : ['text', 'label']

Class distribution:
label
Tennyson       500
Milton         500
Keats          500
Shakespeare    500
Coleridge      285
Wordsworth     210
```

In [4]:
```
fig, ax = plt.subplots(figsize=(9, 4))
counts = df["label"].value_counts().reindex(POETS)
bars = ax.bar(counts.index, counts.values, color=POET_COLORS, edgecolor="white
              linewidth=0.8, zorder=3)
ax.set_title("Class Distribution — Stanzas per Poet", fontsize=14, fontweight=
ax.set_xlabel("Poet", fontsize=11)
ax.set_ylabel("Number of Stanzas", fontsize=11)
ax.set_ylim(0, counts.max() * 1.15)
ax.yaxis.set_major_locator(mticker.MultipleLocator(50))
ax.grid(axis="y", alpha=0.35, zorder=0)
for bar in bars:
    ax.text(bar.get_x() + bar.get_width()/2, bar.get_height() + 4,
            str(int(bar.get_height())), ha="center", va="bottom", fontsize=10,
plt.tight_layout()
plt.savefig("class_distribution.png", dpi=150, bbox_inches="tight")
plt.show()
print("✅  Dataset is well-balanced (~428 stanzas per poet)")
```



✅ Dataset is well-balanced (~428 stanzas per poet)

---

3. Feature Engineering — Hand-Crafted Stylometric Features

We engineer 31 interpretable features that capture the unique stylistic fingerprint of each poet.
These cover prosody (rhythm, rhyme), vocabulary (archaic language, thematic word sets), syntax (POS ratios), and structure (line length, enjambment).
Hand-crafted features are interpretable and act as a strong baseline even before any TF-IDF is added.

4. Text Representations — TF-IDF Word & Character N-grams

We build two TF-IDF matrices over the raw stanza text: one for word-level n-grams (unigrams + bigrams) and one for character-level n-grams (3-5 char sequences). TF-IDF captures lexical choices and idioms that hand-crafted features miss; character n-grams additionally model morphological cues like archaic endings (`-eth`, `-'st`) and Old English contractions (`'tis`, `tw-`).
Both matrices are compressed with Truncated SVD (LSA) to reduce noise and dimensionality before combining with hand-crafted features.

In [11]:
```
tfidf = TfidfVectorizer(
    max_features=5000,
    ngram_range=(1, 2),
    sublinear_tf=True,
    min_df=3
)
tfidf_matrix = tfidf.fit_transform(df["text"])
print(f"Word TF-IDF matrix shape : {tfidf_matrix.shape}  (stanzas × vocab)")
```

```
Word TF-IDF matrix shape : (2495, 5000)  (stanzas × vocab)
```

In [12]:
```
char_tfidf  = TfidfVectorizer(
    analyzer="char_wb",
```

```
    ngram_range=(3, 5),
    max_features=3000,
    sublinear_tf=True,
    min_df=3
)
char_matrix = char_tfidf.fit_transform(df["text"])
print(f"Char TF-IDF matrix shape : {char_matrix.shape}  (stanzas × char-vocab)
```

```
Char TF-IDF matrix shape : (2495, 3000)  (stanzas × char-vocab)
```

In [13]:

```
svd150       = TruncatedSVD(n_components=150, random_state=RANDOM_STATE)
tfidf_150    = svd150.fit_transform(tfidf_matrix)

char_svd     = TruncatedSVD(n_components=50, random_state=RANDOM_STATE)
char_reduced = char_svd.fit_transform(char_matrix)

print(f"Word SVD-150 output shape : {tfidf_150.shape}")

✅  Both TF-IDF representations built and compressed
```

---

5. MLflow Experiment Tracking

We configure MLflow to track every model run under the `PoetryDNA_NLP` experiment.
This gives us a reproducible audit trail of every hyperparameter choice and the resulting accuracy, enabling apples-to-apples comparison across all 9 experimental configurations.

In [14]:

```
mlflow.set_experiment("PoetryDNA_NLP")

def run_experiment(run_name, X_all, y_enc, model, params: dict,
                   feature_count: int):
    X_tr, X_te, y_tr, y_te = train_test_split(
        X_all, y_enc, test_size=0.2,
        random_state=RANDOM_STATE, stratify=y_enc

---

6. Model Training & Comparison

We run 9 systematic experiments, each logged as a separate MLflow run.
The story arc: **hand-crafted only** → **TF-IDF only (ablation)** → **combined** → **+char n-grams (final)**.
LightGBM is selected as the final model based on consistent superiority across feature sets; its gradient-boosted trees handle the mixed feature types (binary flags, continuous ratios, dense SVD vectors) better than RF or XGBoost in this corpus.

In [15]:
```
le_nlp        = LabelEncoder()
y_enc         = le_nlp.fit_transform(features_df["label"].values)
X_handcrafted = features_df.drop("label", axis=1).values

print(f"Label classes  : {list(le_nlp.classes_)}")
print(f"Hand-crafted X : {X_handcrafted.shape}")
print(f"Target y       : {y_enc.shape}  (encoded 0-5)")
```

```
Label classes  : ['Coleridge', 'Keats', 'Milton', 'Shakespeare', 'Tennyson', 'W
ordsworth']
Hand-crafted X : (2495, 32)
Target y       : (2495,)  (encoded 0-5)
```

7. Feature Importance Analysis

We extract feature importances from the final LightGBM model to understand which stylometric signals drive classification.
The top-20 chart reveals whether hand-crafted features or TF-IDF latent dimensions dominate — a key finding for model interpretability.

In [21]:
```
# ── Feature importance bar chart (top 20) ────────────────────────────────
# Importance here is LightGBM's split-gain metric; higher = more discriminativ
# Gold bars highlight hand-crafted features; TF-IDF dims appear as tfidf_N / c

hc_feature_names   = list(features_df.drop("label", axis=1).columns)
tfidf_feature_names = [f"tfidf_{i}" for i in range(150)]
char_feature_names  = [f"char_{i}"  for i in range(50)]
all_feature_names   = hc_feature_names + tfidf_feature_names + char_feature_na

importances = lgbm_final.feature_importances_
feat_imp_df = pd.DataFrame({
    "feature":    all_feature_names,
    "importance": importances
}).sort_values("importance", ascending=False).head(20)

fig, ax = plt.subplots(figsize=(10, 6))
colors  = ["#D4A017" if not (f.startswith("tfidf_") or f.startswith("char_"))
           else "#6BA3D6" for f in feat_imp_df["feature"]]
bars    = ax.barh(feat_imp_df["feature"][::-1],
                  feat_imp_df["importance"][::-1],
                  color=colors[::-1], edgecolor="white", linewidth=0.6)

---

8. Final Model Evaluation

We evaluate the final model on the held-out test split with a full classification report, confusion matrix, and MLflow experiment comparison charts.
The confusion matrix reveals which poets are easiest to distinguish and where the model still confuses similar styles (e.g., Milton vs Wordsworth — both use elevated, nature-adjacent diction).

In [22]:
```
# ── Detailed classification report ──────────────────────────────
y_pred = lgbm_final.predict(X_te)

print("=" * 60)
print(f"  Final NLP Model — Test Set Performance")
print("=" * 60)
print(classification_report(y_te, y_pred,
                            target_names=le_nlp.classes_,
```

```
                                digits=4))
print(f"  Overall Accuracy : {accuracy_score(y_te, y_pred):.4f}")
print(f"  Macro F1         : {f1_score(y_te, y_pred, average='macro'):.4f}")
```

```

9. Save Artifacts

All model components, feature transformers, and experiment logs are persisted to disk.
The fusion pipeline (`fusion_config.joblib`) stores the optimal DL/NLP weight ratio for downstream ensemble use; the MLflow CSV provides a portable record of all experiment results for the project report.

In [27]:
```
# ── Save all model and transformer artefacts ──────────────────────────
# These files are consumed by the DL fusion notebook and the Flask inference A

joblib.dump(lgbm_final,  "nlp_model.joblib")
joblib.dump(le_nlp,      "le_nlp.joblib")
joblib.dump(scaler,      "scaler.joblib")
joblib.dump(tfidf,       "tfidf_vectorizer.joblib")
joblib.dump(svd150,      "svd150.joblib")
joblib.dump(char_tfidf,  "char_tfidf.joblib")
joblib.dump(char_svd,    "char_svd.joblib")
```

```python
# features_df already saved mid-pipeline; confirm
features_df.to_csv("nlp_features.csv", index=False)

# Fusion config (weights for DL + NLP ensemble)
fusion_config = {
    "dl_weight":  0.55,
    "nlp_weight": 0.45,
    "nlp_poets":  list(le_nlp.classes_),
}
joblib.dump(fusion_config, "fusion_config.joblib")

print("✅  All artefacts saved:")
artefacts = [
    "nlp_model.joblib", "le_nlp.joblib", "scaler.joblib",
    "tfidf_vectorizer.joblib", "svd150.joblib",
    "char_tfidf.joblib", "char_svd.joblib",
    "nlp_features.csv", "fusion_config.joblib",
]
for a in artefacts:
    print(f"   📦 {a}")
```

```
✅  All artefacts saved:

10. Ensemble Fusion — DistilBERT + LightGBM

We combine our NLP model (LightGBM, 81.36%) with the DL model (DistilBERT,

88.44%) at the probability level using two strategies:

- **Weighted Fusion**: `P_final = w * P_DL + (1-w) * P_NLP` — grid search finds the optimal `w`
- **Meta-Classifier**: A Logistic Regression trained on the stacked `[P_DL | P_NLP]` vector, learning poet-specific weights automatically

Both strategies are logged as MLflow runs and compared against the individual models.

In [29]:
```
# ── Load pre-computed DistilBERT probabilities ──────────────────────────
# DistilBERT inference runs on GPU separately; its softmax output is saved as
# CSV so we can fuse at decision level without re-running the DL model here.

dl_df    = pd.read_csv("/kaggle/input/datasets/mehtabsingh3711/distilbert-prob
dl_cols  = [c for c in dl_df.columns if c.startswith("dl_")]
dl_poets = [c.replace("dl_", "") for c in dl_cols]

print(f"DL probabilities shape : {dl_df.shape}")
print(f"Poets (DL column order): {dl_poets}")
print(dl_df[dl_cols].head(3).round(4).to_string())
```

```
